[HTML contenteditable Attribute](#)

The `contenteditable` attribute in HTML

Make sure you understand the [difference between an attribute and property](#) and are familiar with the [definitions](#) of other [HTML terms](#).

The `contenteditable` attribute is an enumerated attribute, *not* a [boolean attribute](#). There are four possible ways to code the `contenteditable` attribute to set the `contenteditable` property of an element:

1. omit the `contenteditable` attribute, in which case the value of the `contenteditable` property will be inherited
2. `contenteditable=" "`, which sets the `contenteditable` property to **true**
3. `contenteditable="true"`, which sets the `contenteditable` property to **true**
4. `contenteditable="false"`, which sets the `contenteditable` property to **false**

All other values are not valid.
