### <keygen/> Tag Syntax

```
<a mode="pre" href="#">body-tag/index.html#syntax><body></a>
...
<a mode="pre" href="#">html-tag-list.html#flow-content-model>... flow content expected ...
<<a mode="pre" href="#">form-tag/index.html#syntax>form</a>    <a mode="pre" href="#">html-tag-list.html#phrasing-content-model>... phrasing content e
    ...
</form>
...
<a mode="pre" href="#">html-tag-list.html#phrasing-content-model>... phrasing content expe
    ...
</body>
```

### Rules for coding HTML keygen elements

Make sure you understand the [difference between a tag and element](#) and are familiar with the [definitions of namespace](#) and other [HTML terms](#).

1. Code the **keygen** element where [phrasing content](#) is expected, usually inside a [form element](#).
2. Begin the **keygen** element with a starting <keygen> tag. The element name uses lower case letters and should be in the [HTML namespace](#), which it will pick up automatically from the [xmlns attribute](#) on the <html> tag.
3. If the field is for a form that can be submitted but is *outside* that [form element](#), include a [form attribute](#) referencing the form the keygen is to be associated with.
4. Include any other [attributes on the <keygen> tag](#) as appropriate.
5. Inside the **keygen** element, between the starting <keygen> tag and the ending </keygen> tag, code the inner HTML [phrasing content](#).
6. End the **keygen element** with a matching </keygen> closing tag.

### <keygen/> Content Model

#### Contents of the keygen element

Content: *Empty*. All properties are coded using [attributes](#).

Since the `<keygen/>` tag is a [void element](#), it is not allowed to have any content, even [HTML comments](#) and therefore should always be coded as a self-closing [standalone tag](#), ending with the delimiters `/>` rather than just `>` (`<keygen> ... />`).

## <keygen/> Tag Attributes

### Attributes of the <keygen/> tag

<a href="#">global attributes</a>	In addition to the personal attributes of the <keygen/> tag below, any of the <a href="#">common HTML attributes</a> can also be coded.
<code>autofocus="autofocus"</code>	
<code>challenge</code>	
<code>disabled="disabled"</code>	
<code>form</code>	
<code>keytype="rsa"</code>	
<code>name</code>

## Changes in HTML 5 - <keygen/> Tag

### What's new in HTML 5

### Differences between HTML 5 and earlier versions of HTML

The <keygen/> tag did not exist in older versions of HTML.

The [2000-2010 Recommendations from the W3C HTML Working Group](#) defined the [HTML namespace](#) for the names of all [HTML element types](#), which now includes the **keygen** element name. In older (pre-2000) [versions of HTML](#), element type names were not associated with a namespace.
